

Adding backend to react:-

Download backend code from "<https://github.com/vaishvik12/Ecommerce-backend>"

unzip the backend code

Move the backend code side by side to the front end code

Create a new terminal and cd to the backend-code folder

```
npm install
```

```
npm run dev
```

Your backend server will start on the port 3000

go to <http://localhost:3000/api/products> on your browser

inside your home page componenet fetch the data from the backend using promises

```
// fetch("http://localhost:3000/api/products")
//   .then((response) => {
//     return response.json()
//   }).then((data) => {
//     console.log(data);
//   })
```

Then we will install axios library to simplify fetching the data from the backend

```
import axios from 'axios'
```

```
    axios.get("http://localhost:3000/api/products")
    .then((response) => {
      setProducts(response.data);
    })
```

then use useEffect to load your products only once by using an empty dependency array.

```
import {useEffect} from 'react'
```

```
    useEffect(() => {
    axios.get("http://localhost:3000/api/products")
    .then((response) => {
      console.log(response.data);
    })
  }, [])
```

lastly useState()

```
const [products, setProducts] = useState([]);

useEffect(() => {
  axios.get("http://localhost:3000/api/products")
    .then((response) => {
      setProducts(response.data);
    })
}, [])
```
