

React :-

Components and Props:-

Components :-

In react component is a reusable piece of UI

- Navbar
- Product cart
- cart
- footer
- login form

Functional Components:-

A functional component is simply a component made using a JavaScript function.

Example:-

```
function Welcome() { //PascalCase
  return(<>
    <h1>Welcome</h1>
    <input type="date" />
  </>)
}
```

Props :-

Props means properties:-

Props are used to pass data from one component to another.

Usually parent component sends data.

child component receives data using props.

Props can pass anything:-

string, numbers, arrays, objects, function, event components

Example :-

```
<ChatMessage
  message="Hello"
  sender="user" />
```

```
function ChatMessage({ message, sender })
```

{message, sender} is an example of destructuring props
